

Spatial E/I Differentiation Degrades with Age (N=215)

D. Aging model: coarsening of E/I landscape

YOUNG

OLD

- Fine-grained spatial A pattern
- Many unique sign combinations
- Moderate $|A|$ values
- High pattern entropy H
- Regional E/I specialization

- Coarse spatial A pattern
- Few dominant sign combinations
- Extreme $|A|$ values
- Low pattern entropy H
- Loss of regional specificity

AGING

Not homogenization → but coarsening
 $|A| \uparrow$: each channel becomes more extreme
 $H \downarrow$: fewer unique spatial patterns
→ Loss of fine structure, not loss of structure
